

8211 (HP Anti-Seize) - New Metal-Free Formulation

Belzona is pleased to announce that it has reformulated its product 8211 (HP Anti Seize), a high performance anti seize treatment for the prevention of seizure and galling of mating components, subject to high temperatures, corrosion, chemicals and mechanical interlocking.

As a result of the new formulation, Belzona 8211 (HP Anti Seize) is now completely metal free, which results in a safer and improved corrosion resistant product. Another added benefit to the new formulation is that it now has improved anti- seize properties across a wide temperature range up to 1100°C (2000°F).

The new formulation also offers improved washout resistance against exposure to rain or plant deluge/sprinkler tests, and high purity levels (low in chlorine and other halogens) to eliminate stress corrosion problems.

Belzona 8211 (HP Anti Seize) can be used on a wide variety of applications including nuts, bolts, keys, sleeves, couplings and fulcrum pins.

Through an aggressive research and development programme Belzona is continuously developing market driven solutions to meet the ever increasing demands of industry and commerce. This reformulation shows Belzona commitment to staying at the forefront of innovation, and continuously providing higher levels of performance.
